

A generic code of urban mobility: how cities can achieve sustainable development

A study based on the R&D project “What Cities Want” on behalf of MAN SE

Roland Priester, Montserrat Miramontes, Gebhard Wulfhorst
Chair of Urban Structure and Transport Planning

Monday, May 19, 2014
mobil.TUM 2014

High diversity among cities and their transport systems...

...but common challenges

1900 | 2 out of every 10 people lived in an urban area

1990 | 4 out of every 10 people lived in an urban area

2010 | 5 out of every 10 people lived in an urban area

2030 | 6 out of every 10 people will live in an urban area

2050 | 7 out of every 10 people will live in an urban area

Urbanization

Motorization

Environmental constraints

A generic code of urban mobility

TUM

Hypothesis

Cities and their transport systems may look different but...

they are comprised of the same components and driven by the same processes –

Hence, there is a *generic code* of urban mobility.

Study objectives

- Describe and explain the complex system of urban mobility by a qualitative model approach
- Verify model assumptions for international case-study cities
- Identify future strategies for sustainable urban mobility

Methodology: 3 modules

1. Building up a system model „urban mobility“ using the sensitivity model by Frederic Vester
2. Survey of local experts from 15 cities worldwide on the perspectives of transport and urban development
3. Roundtable workshop with representatives from all surveyed cities on October 8/9, 2012 in Munich

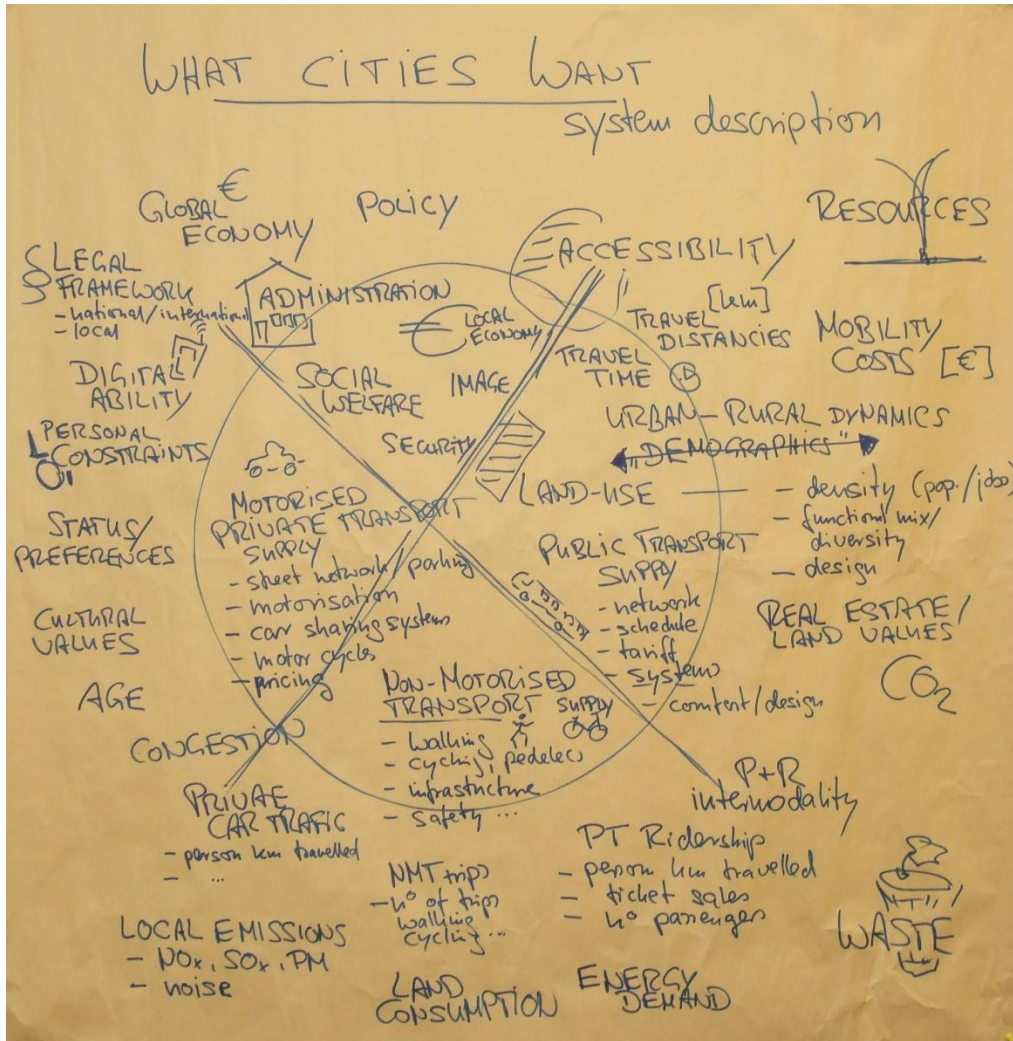

Methodology: Sensitivity model by F. Vester

- Development since 1970s by Frederic Vester
- Tool helping to explain complex systems
- Typical problems when dealing with complex systems
 - curing the symptoms and not the disease
 - involuntary side effects
 - too much intervention
- Biocybernetics as problem-solving approach → Learning from nature

1. System description

- Create a system picture
- Visualization improves understanding
- Helps to identify system elements and processes

2. Set of variables

List of variables		Variablenbeschreibung	
1	legal framework	1	legal framework
2	city policies		
3	organisation & administration		
4	public budget		
5	local economy		
6	urban density		
7	urban-rural dynamics		
8	real estate values		
9	socio-economic pop. structure		
10	sustain. mobility orientation		
11	city image		
12	road infrastructure		
13	car ownership		
14	(congestion) traffic flow		
15	trip duration		
16	PT infrastructure		
17	PT service quality		
18	NMT infrastructure		
19	intermodality		
20	new mobility services		
21	ICT for mobility services		
22	mot. private mode share		
23	PT mode share		
24	NMT mode share		
25	mobility costs		
26	transport safety and security		
27	social equity		
28	transport energy demand		
29	environmental impacts		

- Define influencing variables
- Operationalize the system picture
- Both types of variables, quantitative and qualitative ones
- As much as necessary, as little as possible
- Explanation for common understanding needed

3. Impact matrix

Influence by variable ↓ on variable →

	1	2	3	4	5	6	7	8	9	10	11	12	13	14	15	16	17

real estate values (8)

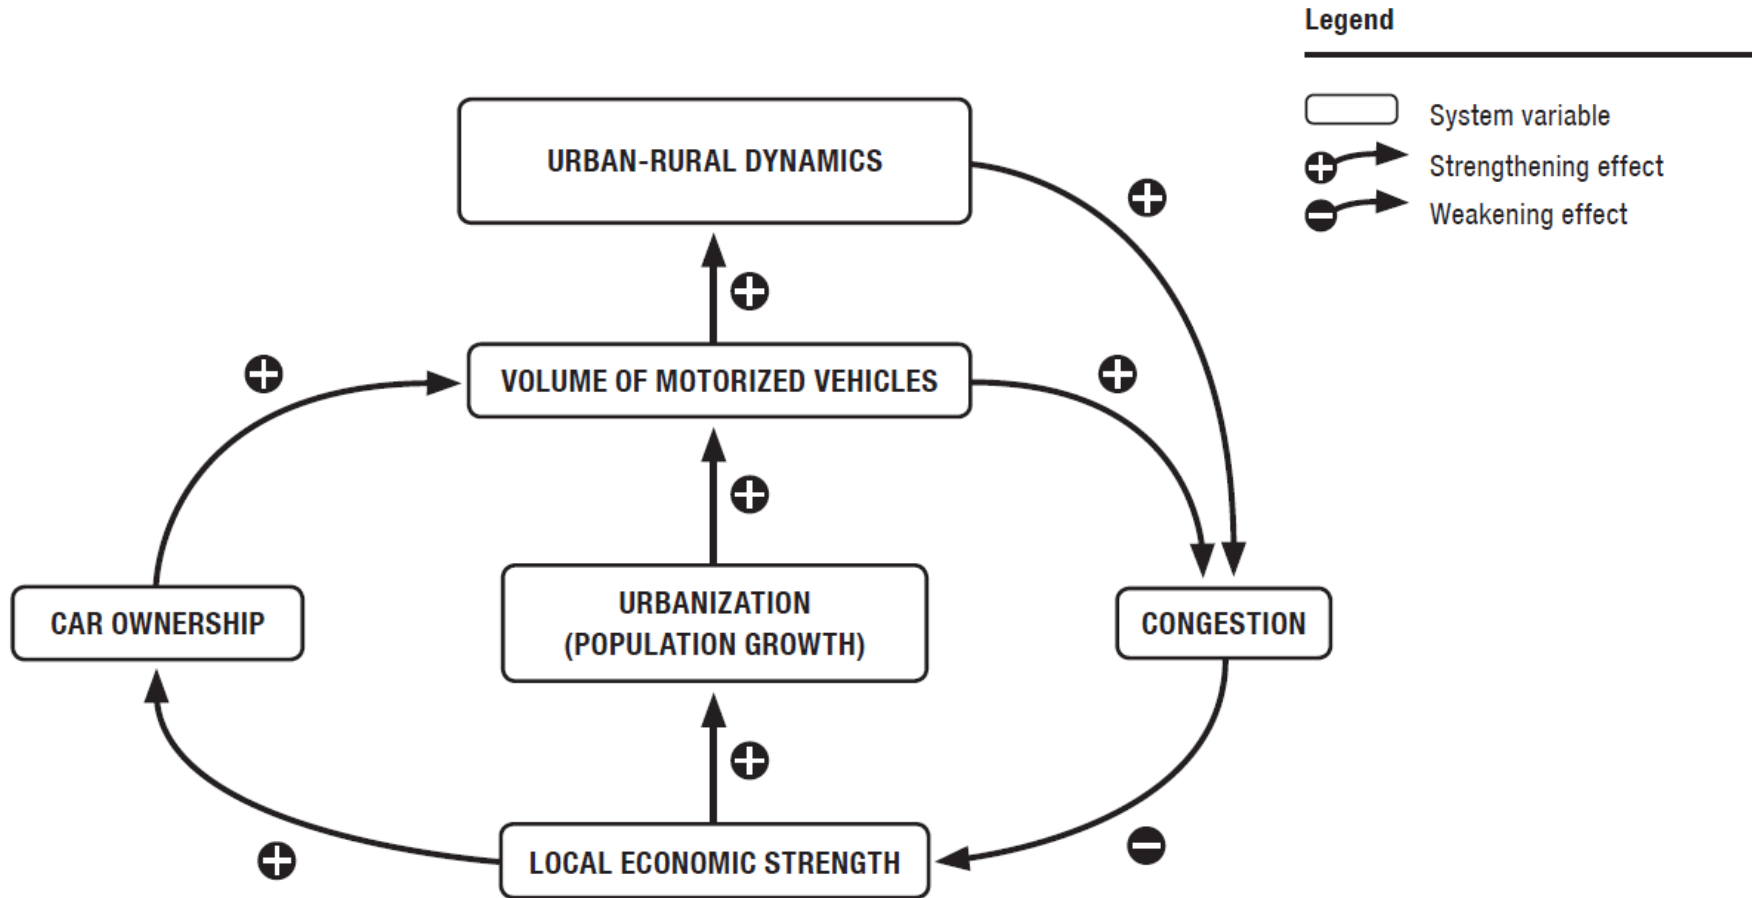

5. Effect system (Generic code)

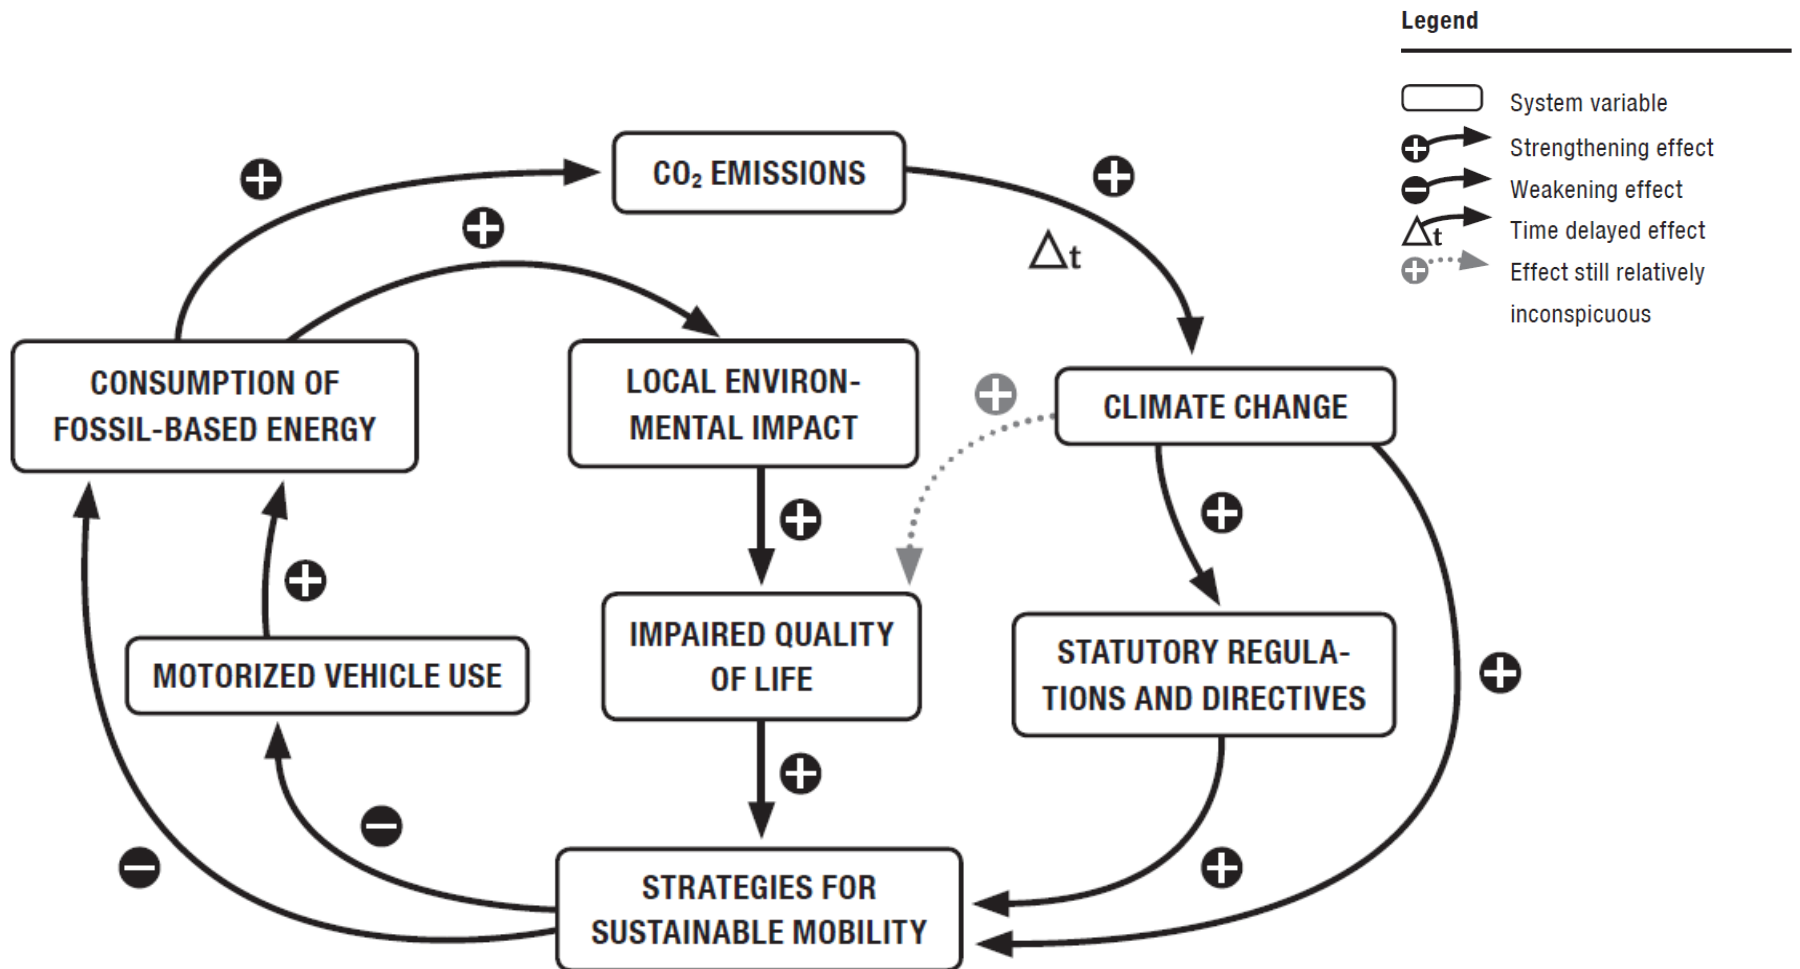

5. Effect system (Generic code)

Economic development and urbanization

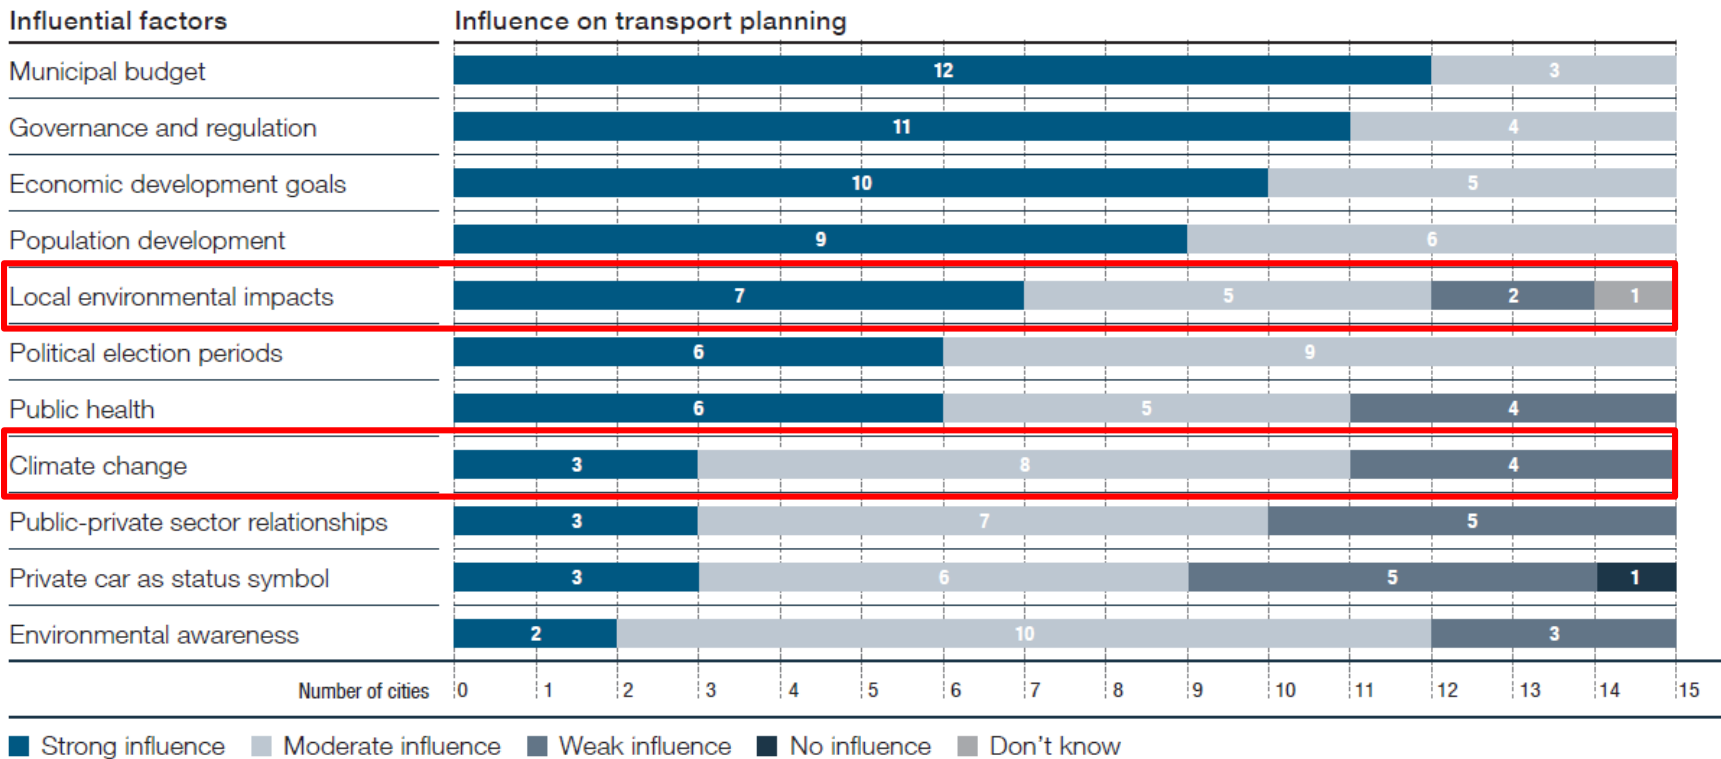

Environmental impact and climate change

Environmental impact and climate change

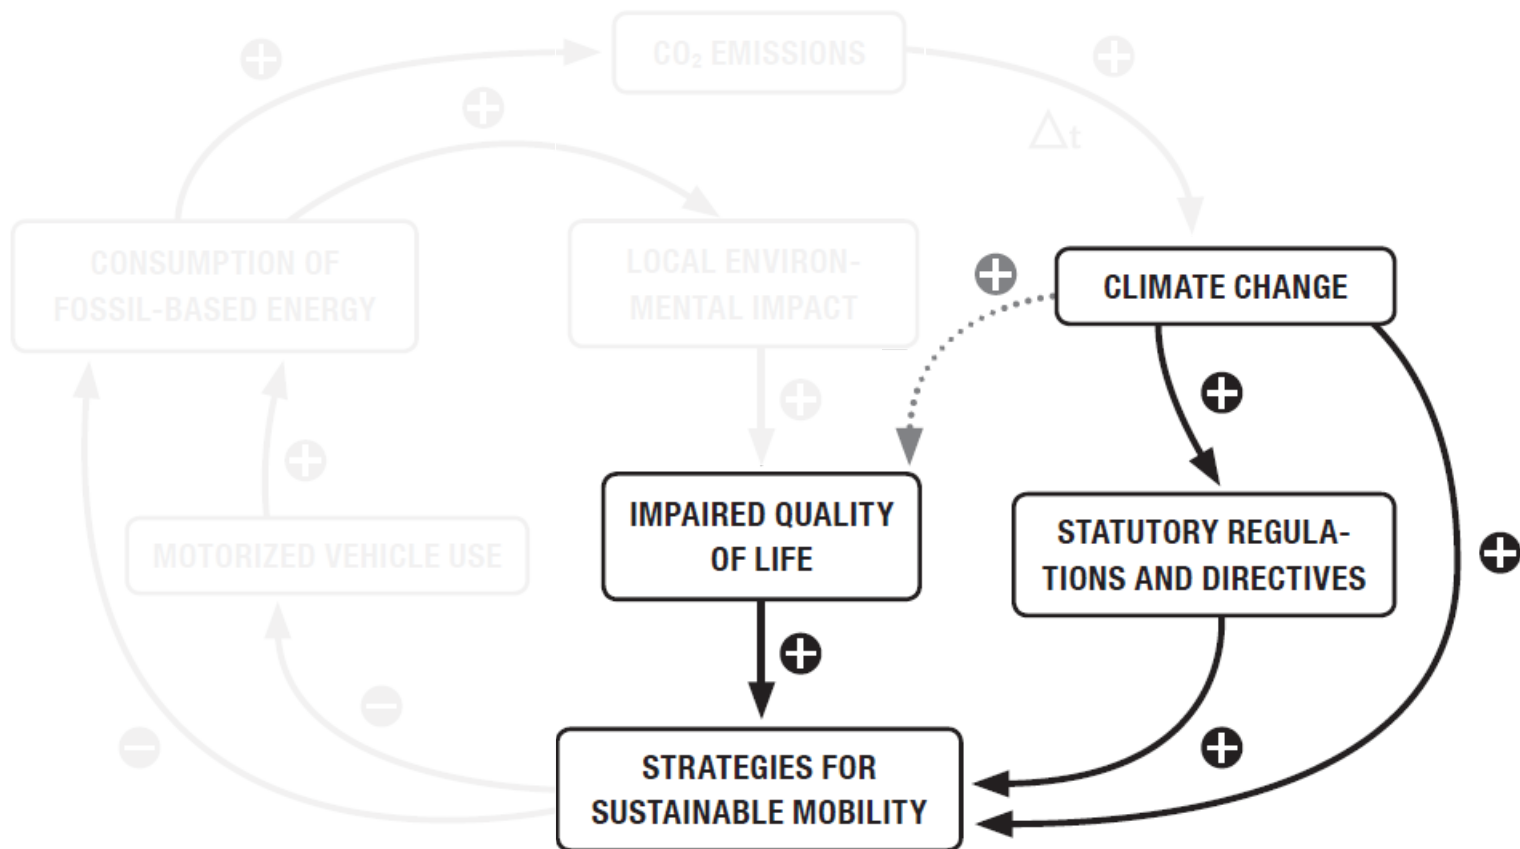

Local environmental impacts have a stronger influence on transport planning than climate change

Importance of different influential factors for transport planning

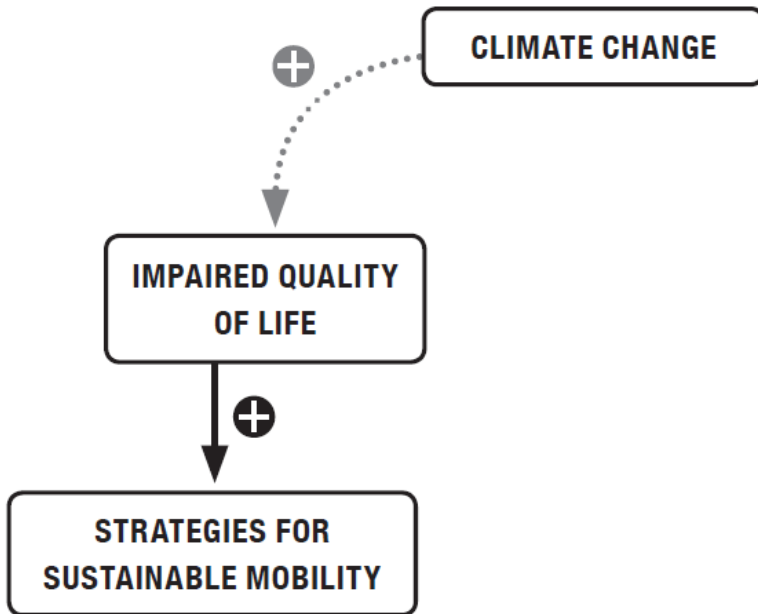

Environmental impact and climate change

How do cities cities with the challenge of climate change?

Environmental impact and climate change

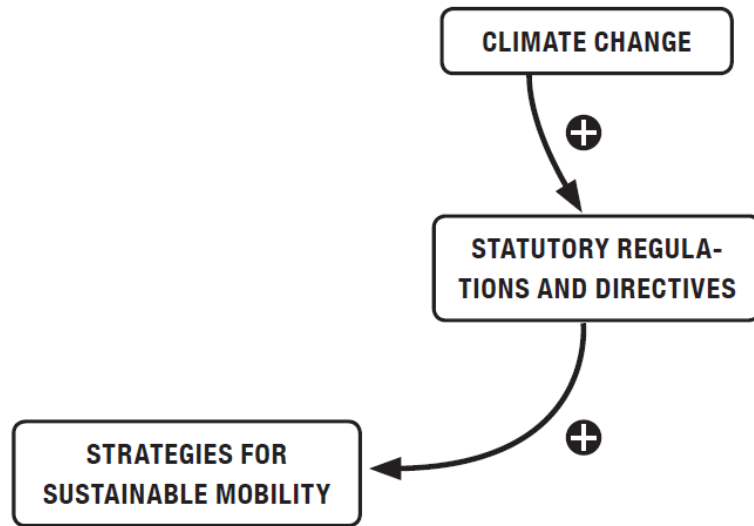

Not yet noticeable in most case-study cities, but

- Concerns in Singapore about rising sea level
- Melbourne expects increased risk of bushfires

Environmental impact and climate change

Example: Sao Paulo

ENVIRONMENTAL REGULATIONS

Federal

CONAMA – Resolução 418/09
PCPV / In Use Vehicles Inspection

+

Municipal

Law N° 14.933/09 (Climate changes prevention)
2018 – bus fleet must run on 100% renewable fuels
2009 – start Program substituting 10% each year

PCPV

Vehicle Pollution Control Plan

✓ Diesel

- ✓ Biodiesel
- ✓ Ethanol
- ✓ Sugar Cane Diesel

- ✓ Trolleybus
- ✓ Hybrid
- ✓ Battery
- ✓ Fuel Cell Bus

Environmental impact and climate change

Example: Copenhagen

Copenhagen Climate Plan

- 20% CO₂-reduction 2005-2015
- CO₂ neutral by 2025

Copenhagen's ambitious plans:

36%

of all trips to work or educational institutions in Copenhagen are by bicycle,*
equalling 0 tonnes of CO₂ emissions.

This high percentage of the modal share is a key element in the declared goal of making Copenhagen

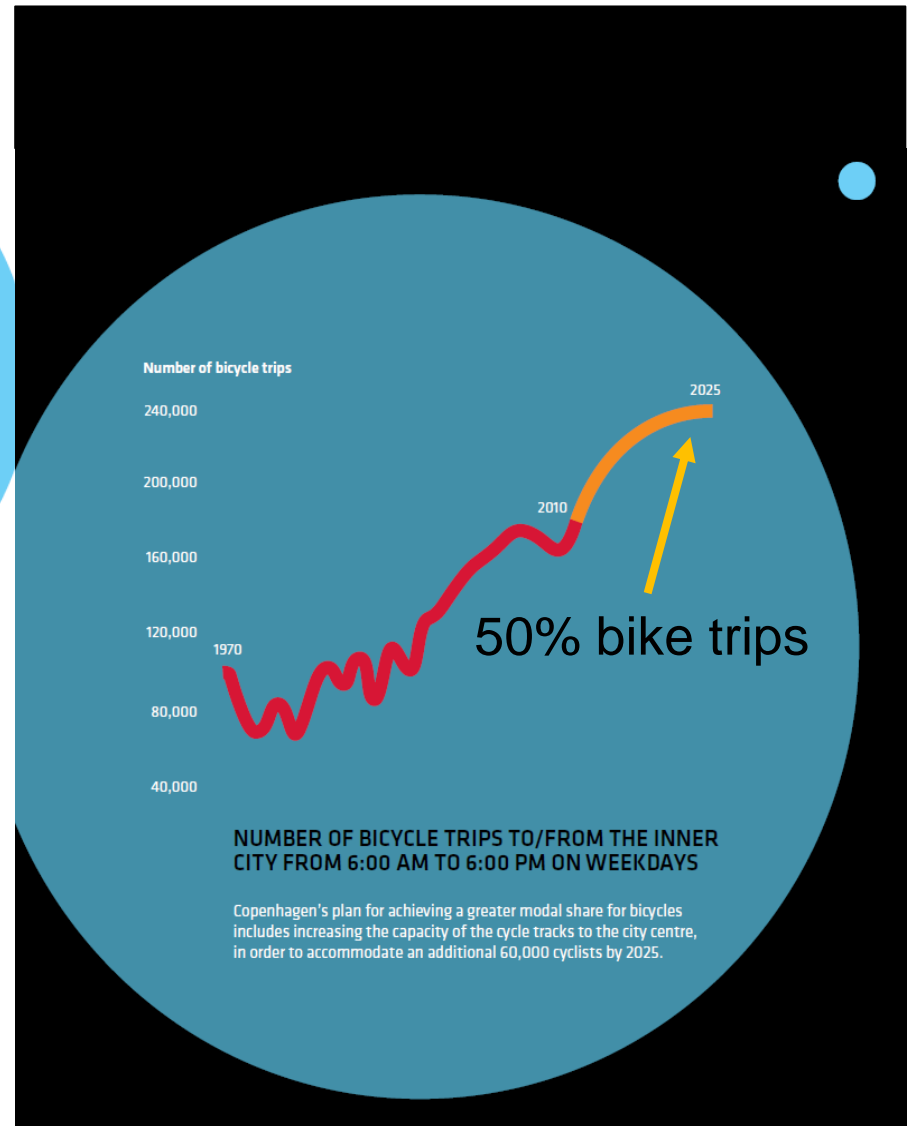

**CO₂-neutral
by 2025**

*Average 2008-2010

A BETTER BICYCLE CITY A MORE LIVEABLE CITY

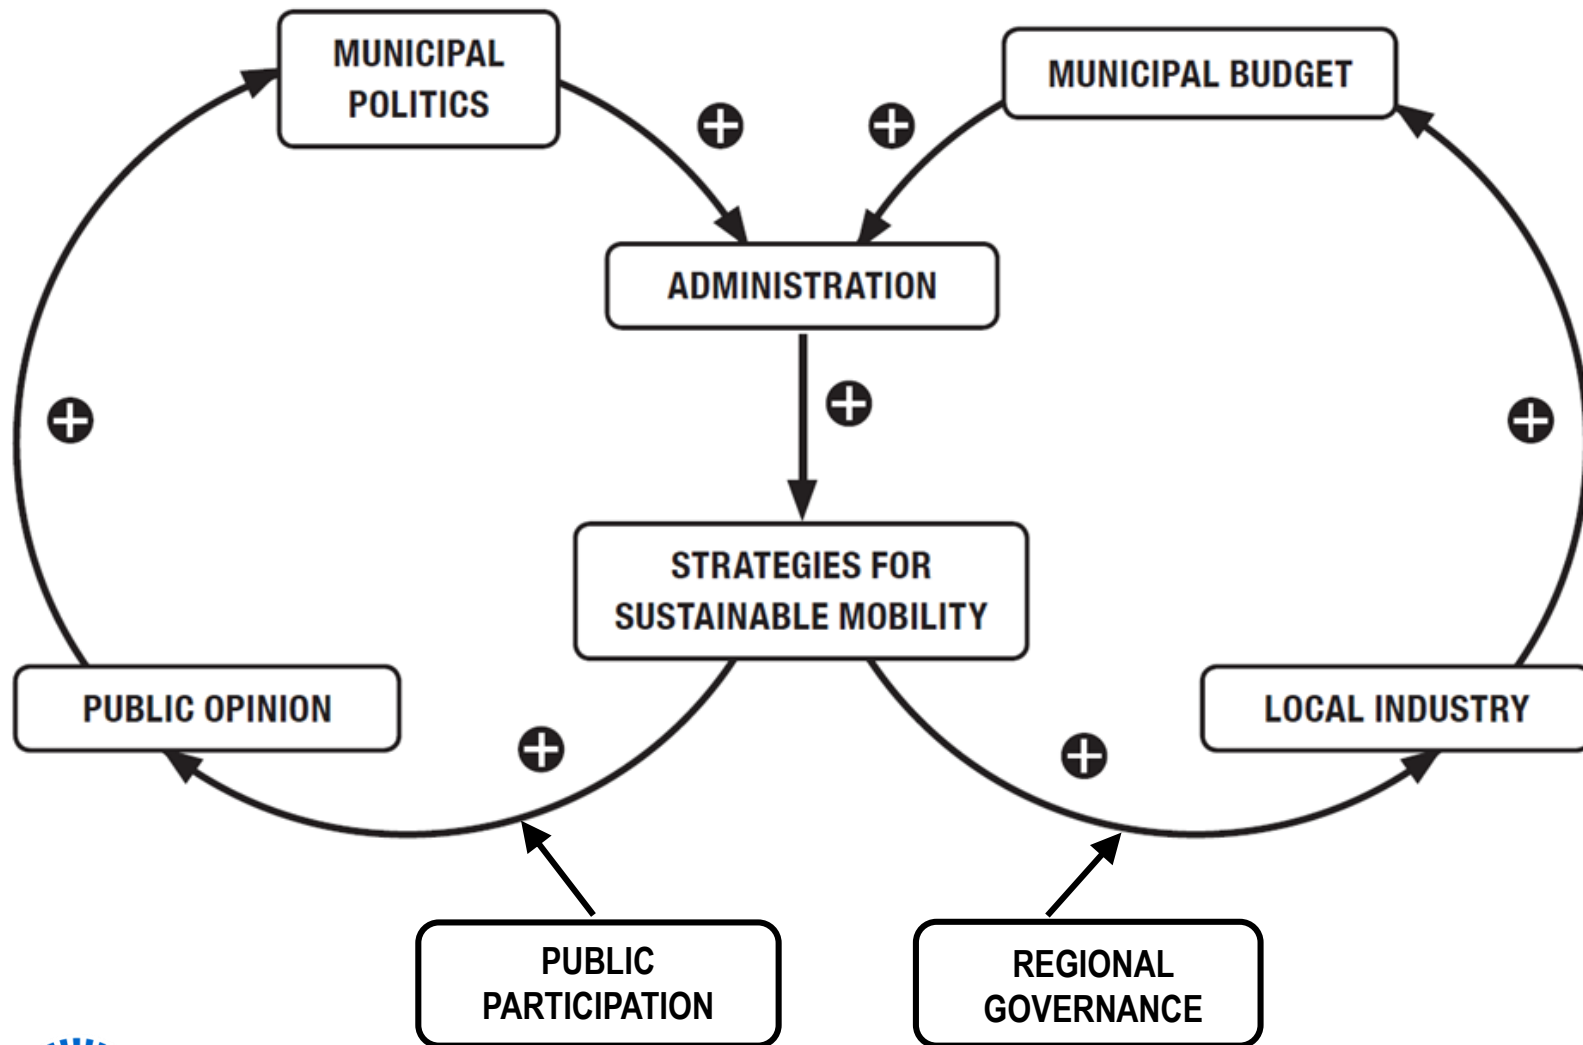

A bicycle-friendly city is a city with more space, less noise, cleaner air, healthier citizens and a better economy. It's a city that is a nicer place to be in and where individuals have a higher quality of life. Where accessibility is high and there is a short route from thought to action if one wants to head out into nature, participate in cultural or sports activities or buy locally. Bicycle traffic is therefore not a singular goal but rather an effective tool to use when creating a liveable city with space for diversity and development.

Fortunately, it pays off to invest in urban cycling. Increased cycling levels give society less congestion, fewer sick days, longer life expectancy, less wear and tear on the roads and less pollution. Cycling initiatives are also inexpensive compared with other transport investments.

Beispiel
Beirut:

Umsetzungsprobleme aufgrund von zersplitterten Zuständigkeiten im Verkehrsbereich

- Stadt
- Verwaltungsbezirk,
- Innenministerium,
- Ministerium für öffentliche Arbeiten und Verkehr,
- Rat für Entwicklung und Wiederaufbau
- öffentlichen Verkehrsbehörde

Rolle der Variablen

PT infrastructure

Sehr wirksame, aber kritische Komponente, deren Entwicklung im Auge behalten werden muß, insbesondere, wenn man sie ändert, um damit Weichen zu stellen.

Schließen

Rolle der Variablen

image

Die bereits starke Reaktion dieser leicht kritischen Komponente auf Veränderungen im System (auch wenn durch sie selbst verursacht) macht sie für gezielte steuernde Eingriffe ungeeignet. Ein unzuverlässiger, aber - weil leicht zu handhaben - auch verführerischer Hebel.

Schließen

Rolle der Variablen

social equity

Leicht reaktive und schwach puffernde Komponente, die bei der Selbstregulation des Systems mitwirkt, ohne jedoch Indikator zu sein.

Schließen

Rolle der Variablen

urban-rural dynamics

Hier finden sich starke Beschleuniger und Katalysatoren, die zwar als Initialzündung geeignet sind, um Dinge überhaupt in Gang zu bringen. Unkontrolliertes Aufschaukeln und Umkippen ist jedoch dabei sehr leicht möglich, daher höchste Vorsicht (Samthandschuhe)!
